2	

The present invention includes a method for inhibiting hydrate formation	
blockage in a flow line used to transport hydrocarbon containing fluids. Water	
is added to a hydrocarbon containing fluid to produce a water cut enhanced	
hydrocarbon containing fluid. Salt may be added to the hydrocarbon	
containing fluids as well. Hydrate formation blockage is inhibited from forming	
within the flow line by the addition of the water and/or the salt. Sufficient water	
may be added such that the hydrocarbon containing fluid is converted from a	
water in oil emulsion to a water continuous emulsion. A system for preventing	
the formation of hydrate blockage in conduits is also provided. The system	
includes a flow line for transporting a hydrocarbon containing fluid and a water	
injection conduit fluidly connected to the flow line to add water to the flow line	
to increase the water cut of a hydrocarbon containing fluid flowing through the	
flow line. A salt dispenser may also be included which is used to increase the	
salinity of the hydrocarbon containing fluid. The system may further include a	
water separator to separate hydrocarbons from water which receives fluids	
from the flow line. The flow line, water separator and water injection conduit	
may cooperate to form a loop wherein water from the flow line may be	
separated by the water separator and a portion of the separated water is	
delivered back to the water injection conduit to be reinjected into the flow line.
